

AIVA

AI-enabled clinical documentation, built into your WinVoice workflow

- ✓ Healthcare-specific AI Voice Assistant
- ✓ Powered by Corti's Ambient Voice Technology (AVT)
- ✓ Embedded within the WinVoice workflow
- ✓ Built for health and care professionals
- ✓ Capture clinical conversations using AVT
- ✓ Healthcare-specific language and contextual understanding
- ✓ Secure integration with existing healthcare systems.

AIVA is Voice Technologies' AI Voice Assistant, powered by Corti's AVT. Embedded within Voice Technologies' WinVoice document workflow platform, AIVA brings healthcare-specific AI directly into the clinical documentation process.

Rather than adding another standalone system for clinicians and teams to manage, AIVA works as part of the existing workflow – helping transform clinical conversations and voice into accurate, structured documentation.

From conversation to clinical documentation

AIVA uses AVT to capture and transcribe clinical conversations, with healthcare-specific AI providing contextual understanding and intelligent automation.

Combined with WinVoice, it creates a connected process from voice capture and transcription through document creation, review, approval and secure distribution.

The result is a smarter documentation workflow designed around the way healthcare teams work.

WinVoice + AIVA = less documenting, more patient care

What could AIVA mean for your teams?

For clinicians

Reduce the administrative burden of clinical documentation, freeing up more time to focus on patients.

For administrative teams

Reduce manual handling and repetitive tasks, helping information move more efficiently through the documentation process.

For digital and eHealth teams

Introduce healthcare-specific AI within a controlled, integrated workflow rather than adding another disconnected technology platform.

AI that works with your workflow

AIVA enhances the WinVoice platform which integrates with existing healthcare systems and infrastructure. Workflows can be configured around different departments, user roles and organisational requirements.

This allows you to explore the benefits of AI-enabled documentation while maintaining the workflow, governance and visibility required in the NHS.

Corti is a clinical-grade AI platform and frontier lab specialising in medical speech-to-text, text generation and automated medical coding.

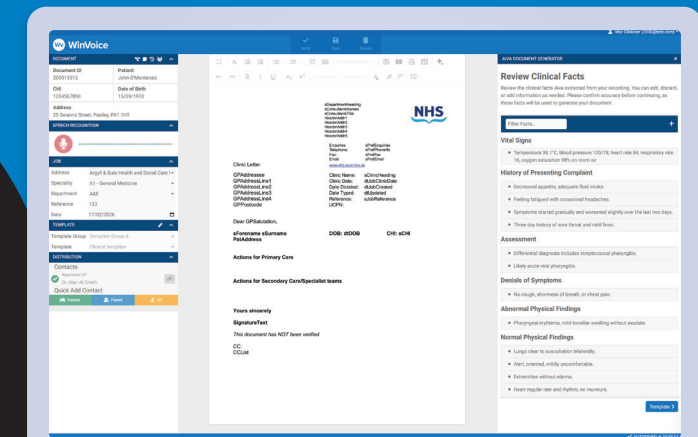

Voice Technologies partners with Corti to combine specialist healthcare AI with VT's proven document workflow technology within existing NHS workflows.

WinVoice is a complete end-to-end solution developed by Voice Technologies in collaboration with the NHS in the UK.

Launched in 2008, it enables users to create letters, reports and other documents and distribute them electronically or in print.

AIVA represents the next stage in that journey: combining Voice Technologies' experience of NHS document workflows with Corti's specialist healthcare AVT.
